# The Isomorphism Theorem of *-Bisimple Type $A \omega^{2}$-Semigroups 

Yu SHANG ${ }^{1, *}$, Limin WANG ${ }^{2}$<br>1. Department of Mathematics, Simao Teacher's College, Yunnan 665000, P. R. China;<br>2. School of Mathematics, South China Normal University, Guangdong 510631, P. R. China

#### Abstract

In this paper we study the isomorphisms of two *-bisimple type $A \omega^{2}$-semigroups such that $\mathcal{D}^{*}=\widetilde{D}$ and obtain a criterion for isomorphisms of two such semigroups.

Keywords Type $A$ semigroup; *-bisimple $\omega^{2}$-semigroup; generalized Bruck-Reilly *-extension; isomorphism.

MR(2010) Subject Classification 20M10

## 1. Preliminaries

Earlier investigations in [1] studied $*$-bisimple type $A \omega^{2}$-semigroups whose equivalence $D^{*}$ and $\widetilde{\mathcal{D}}$ coincide, characterizing them as the generalized Bruck-Reilly $*$-extensions of cancellative monoids. The results of [1] generalize those of regular bisimple $\omega^{2}$-semigroups. In this paper, we give necessary and sufficient conditions for two $*$-bisimple type $A \omega^{2}$-semigroups with $\mathcal{D}^{*}=\widetilde{D}$ to be isomorphic. We complete this section with a summary of notions of type $A$ semigroups, the details of which can be found in [1], [2] and [3].

For any semigroup $S$ we shall denote by $E_{S}$ the set of idempotents of $S$. Let $S$ be a semigroup whose set $E_{S}$ is non-empty. We define a partial ordering $\geq$ on $E_{S}$ by the rule that $e \geq f$ if and only if $e f=f=f e$. Let $N^{0}$ denote the set of all non-negative integers and $N$ denote the set of all positive integers. We define a partially order on $N^{0} \times N^{0}$ in the following manner: if $(m, n),(p, q) \in N^{0} \times N^{0}$,

$$
(m, n) \leq(p, q) \text { if and only if } m>p \text { or, } m=p \text { and } n \geq q
$$

The set $N^{0} \times N^{0}$ with the above partially order is called an $\omega^{2}$-chain, and denoted by $C_{\omega^{2}}$. Any partially ordered set order isomorphic to $C_{\omega^{2}}$ is also called an $\omega^{2}$-chain. We say that a semigroup $S$ is an $\omega^{2}$-semigroup if and only if $E_{S}$ is order isomorphic to $C_{\omega^{2}}$. Thus, if $S$ is an $\omega^{2}$-semigroup, then we can write

$$
E_{S}=\left\{e_{m, n}: m, n \in N^{0}\right\}
$$

[^0]where $e_{m, n} \leq e_{p, q}$ if and only if $(m, n) \leq(p, q)$.
Let $S$ be a semigroup. Let $a, b \in S$ such that for all $x, y \in S^{1}, a x=a y$ if and only if $b x=b y$. Then $a, b$ are said to be $\mathcal{L}^{*}$-equivalent and written $a \mathcal{L}^{*} b$. Dually, $a \mathcal{R}^{*} b$ if for all $x, y \in S^{1}, x a=y a$ if and only if $x b=y b$. If $S$ has an idempotent $e$, then the following characterisation is known.

Lemma 1.1 ([3]) Let $S$ be a semigroup and $e$ an idempotent in $S$. Then the following statements are equivalent:
(i) $e \mathcal{L}^{*} a$;
(ii) $a e=a$ and for all $x, y \in S^{1}, a x=a y$ implies $e x=e y$.

By duality, a similar statement holds for $\mathcal{R}^{*}$. A semigroup in which each $\mathcal{L}^{*}$ - and each $\mathcal{R}^{*}$ class contains an idempotent is called an abundant semigroup [2]. The join of the equivalence relations $\mathcal{L}^{*}$ and $\mathcal{R}^{*}$ is denoted by $\mathcal{D}^{*}$ and their intersection by $\mathcal{H}^{*}$. Thus $a \mathcal{H}^{*} b$ if and only if $a \mathcal{L}^{*} b$ and $a \mathcal{R}^{*} b$. In general $\mathcal{L}^{*} \circ \mathcal{R}^{*} \neq \mathcal{R}^{*} \circ \mathcal{L}^{*}$ and neither equals $\mathcal{D}^{*}$. Basically, $a \mathcal{D}^{*} b$ if and only if there exist $x_{1}, x_{2}, \ldots, x_{2 n-1}$ in $S$ such that $a \mathcal{L}^{*} x_{1} \mathcal{R}^{*} x_{2} \mathcal{L}^{*} \cdots \mathcal{L}^{*} x_{2 n-1} \mathcal{R}^{*} b$. Let $H^{*}$ be an $\mathcal{H}^{*}$-class in a semigroup $S$ with $e \in H^{*}$, where $e$ is an idempotent in $S$. Then $H^{*}$ is a cancellative monoid. Denote by $\mathcal{R}, \mathcal{L}$ the left and right Green's relations respectively, on $S$. Evidently $\mathcal{L} \subseteq \mathcal{L}^{*}, \mathcal{R} \subseteq \mathcal{R}^{*}$, and so, $\mathcal{D} \subseteq \mathcal{D}^{*}, \mathcal{H} \subseteq \mathcal{H}^{*}$. If $S$ is a regular semigroup, then $\mathcal{L}^{*}=\mathcal{L}, \mathcal{R}^{*}=\mathcal{R}$. An $\mathcal{L}^{*}$-class containing an element $a \in S$ will be denoted by $L_{a}^{*}$. Similarly $R_{a}^{*}$ is an $\mathcal{R}^{*}$-class with an element $a \in S$. To avoid ambiguity we at times denote a relation $\mathcal{K}$ on $S$ by $\mathcal{K}(S)$. Let $S$ be a semigroup with a semilattice $E$ of idempotents. Then $S$ is called a right adequate semigroup if each $\mathcal{L}^{*}$-class of $S$ contains an idempotent. Dually, we have the notion of a left adequate semigroup. If $S$ is a right (left) adequate semigroup, then each $\mathcal{L}^{*}$ - $\left(\mathcal{R}^{*}\right.$-) class of $S$ contains a unique idempotent. For an element $a$ of such a semigroup, the idempotent in the $\mathcal{L}^{*}-\left(\mathcal{R}^{*}-\right)$ class containing $a$ will be denoted by $a^{*}\left(a^{+}\right)$. A semigroup which is both left and right adequate will be called an adequate semigroup. A right (left) adequate semigroup $S$ is called a right (left) type $A$ semigroup if $e a=a(e a)^{*}\left(a e=(a e)^{+} a\right)$ for all elements $a$ in $S$ and all idempotents $e$ in $S$. An adequate semigroup $S$ is type $A$ if it is both right and left type $A$. Let $S$ be a type $A$ semigroup with a semilattice of idempotents $E$. Then $S$ is called type $A$ $\omega^{2}$-semigroup if $E$ is an $\omega^{2}$-chain. Thus in a type $A \omega^{2}$-semigroup $E_{S}=\left\{e_{m, n}: m, n \in N\right\}$ and $e_{m, n} \geq e_{p, q}$ if and only if $(m, n) \geq(p, q)$. In such a semigroup $S$, we will denote by $L_{m, n}^{*}$ (resp. $\left.R_{m, n}^{*}\right)$ the $\mathcal{L}^{*}$-class (resp. $\mathcal{R}^{*}$-class) containing idempotent $e_{m, n}$. That is

$$
\begin{aligned}
R_{m, n}^{*} & =\left\{a \in S: a \mathcal{R}^{*} e_{m, n}\right\} \\
L_{p, q}^{*} & =\left\{a \in S: a \mathcal{L}^{*} e_{p, q}\right\}
\end{aligned}
$$

Let $H_{(m, n),(q, p)}^{*}$ denote the $R_{m, n}^{*} \cap L_{p, q}^{*}$. That is

$$
H_{(m, n),(q, p)}^{*}=\left\{a \in S: a \mathcal{R}^{*} e_{m, n}, a \mathcal{L}^{*} e_{p, q}\right\}
$$

If $H_{(m, n),(q, p)}^{*} \neq \emptyset$, evidently $H_{(m, n),(q, p)}^{*}$ is an $\mathcal{H}^{*}$-class of $S$. Also, observe that $a^{+}=e_{m, n}$ and $a^{*}=e_{p, q}$. If $S$ is a type $A \omega^{2}$-semigroup, then $S$ is $*$-bisimple if and only if it has a single
$\mathcal{D}^{*}$-class. Let $S$ be a type $A$ semigroup, and let $a, b \in S$. The relation $\widetilde{\mathcal{D}}$ is defined on $S$ by

$$
a \widetilde{\mathcal{D}} b \text { if and only if } a^{*} \mathcal{D} b^{*} \text { and } a^{+} \mathcal{D} b^{+} \text {for } a^{*}, b^{*}, a^{+}, b^{+} \in E(S)
$$

$\widetilde{\mathcal{D}}$ is an equivalence relation and satisfies the inclusion $\mathcal{D} \subseteq \widetilde{\mathcal{D}} \subseteq \mathcal{D}^{*}$ on a type $A$ semigroup $S$ (see [4]).

Lemma 1.2 ([5]) Let $S$ be an adequate semigroup. The following conditions are equivalent:
(i) $\mathcal{D}^{*}=\widetilde{\mathcal{D}}$;
(ii) Every nonempty $\mathcal{H}^{*}$-class contains a regular element.

Furthermore, if (i) or (ii) holds, then $\mathcal{D}^{*}=\mathcal{L}^{*} \circ \mathcal{R}^{*}=\mathcal{R}^{*} \circ \mathcal{L}^{*}$.
In [1], Shang and Wang introduced the generalized Bruck-Reilly *-extension. Consider a monoid $T$ with $H_{e}^{*}$ and $H_{e}$ as the $\mathcal{H}^{*}$ - and $\mathcal{H}$-class which contains the identity $e$ of $T$, respectively. Let $\beta, \gamma$ be two homomorphisms from $T$ into $H_{e}^{*}$. Let $u$ be an element in $H_{e}$ and $\tau_{u}$ be the inner automorphism of $H_{e}^{*}$ defined by $x \rightarrow u x u^{-1}$ such that

$$
\begin{equation*}
\gamma \tau_{u}=\beta \gamma \tag{1.1}
\end{equation*}
$$

We can make $S=N^{0} \times N^{0} \times T \times N^{0} \times N^{0}$ into a semigroup by defining

$$
\begin{aligned}
& (m, n, a, q, p)\left(m^{\prime}, n^{\prime}, a^{\prime}, q^{\prime}, p^{\prime}\right) \\
& = \begin{cases}\left(m, n-q+\max \left(q, n^{\prime}\right), a \beta^{\max \left(q, n^{\prime}\right)-q} a^{\prime} \beta^{\max \left(q, n^{\prime}\right)-n^{\prime}}, q^{\prime}-n^{\prime}+\max \left(q, n^{\prime}\right), p^{\prime}\right) & \text { if } p=m^{\prime} \\
\left(m, n, a\left(u^{-n^{\prime}} a^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}, q, p^{\prime}-m^{\prime}+p\right) & \text { if } p>m^{\prime} \\
\left(m-p+m^{\prime}, n^{\prime},\left(u^{-n} a \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} a^{\prime}, q^{\prime}, p^{\prime}\right) & \text { if } p<m^{\prime}\end{cases}
\end{aligned}
$$

where $\beta^{0}, \gamma^{0}$ are interpreted as the identity map of $T$ and $u^{0}$ is interpreted as the identity $e$ of $T$. Then $S$ is a semigroup with identity ( $0,0, e, 0,0$ ). The semigroup $S=N^{0} \times N^{0} \times T \times N^{0} \times N^{0}$ constructed above will be called the generalized Bruck-Reilly $*$-extension of $T$ determined by $\beta$, $\gamma, u$ and will be denoted by $S=G B R^{*}(T ; \beta, \gamma ; u)$. Let $(m, n, a, q, p) \in S$. Then $(m, n, a, q, p)$ is an idempotent if and only if $m=p, n=q$ and $a$ is an idempotent.

Lemma 1.3 ([1]) Let $S=G B R^{*}(T ; \beta, \gamma ; u)$ be a generalized Bruck-Reilly *-extension of a monoid $T$ determined by $\beta, \gamma$, u. Suppose that ( $m, n, a, q, p$ ) and ( $m^{\prime}, n^{\prime}, a^{\prime}, q^{\prime}, p^{\prime}$ ) are elements in S. Then
(i) $(m, n, a, q, p) \mathcal{L}^{*}(S)\left(m^{\prime}, n^{\prime}, a^{\prime}, q^{\prime}, p^{\prime}\right)$ if and only if $q=q^{\prime}, p=p^{\prime}$ and $a \mathcal{L}^{*}(T) a^{\prime}$.
(ii) $(m, n, a, q, p) \mathcal{R}^{*}(S)\left(m^{\prime}, n^{\prime}, a^{\prime}, q^{\prime}, p^{\prime}\right)$ if and only if $m=m^{\prime}, n=n^{\prime}$ and $a \mathcal{R}^{*}(T) a^{\prime}$.

Lemma $1.4([1])$ Let $S=G B R^{*}(T ; \beta, \gamma ; u)$. Then an element ( $m, n, a, q, p$ ) in $S$ has an inverse $(x, y, b, z, w) \in S$ if and only if $b$ is the inverse of $a$ in $T, x=p, y=q, z=n$ and $w=m$.

Lemma 1.5 ([1]) Let $M$ be a cancellative monoid with identity $e$ and $S=G B R^{*}(M ; \beta, \gamma ; u)$ the generalized Bruck-Reilly *-extension of $M$ determined by $\beta, \gamma$, u, where $\beta: M \rightarrow H_{e}^{*}, \gamma$ : $M \rightarrow H_{e}^{*}, u \in H_{e}$ and $H_{e}^{*}, H_{e}$ are the $\mathcal{H}^{*}$-class and $\mathcal{H}$-class of $M$ containing the identity $e$ of $M$, respectively. Then $S=G B R^{*}(M ; \beta, \gamma ; u)$ is a $*$-bisimple type $A \omega^{2}$-semigroup such that $\mathcal{D}^{*}(S)=\widetilde{D}(S)$. Conversely, every *-bisimple type $A \omega^{2}$-semigroup such that $\mathcal{D}^{*}=\widetilde{D}$ is
isomorphic to some $G B R^{*}(M ; \beta, \gamma ; u)$.

## 2. The isomorphism theorem

In this section, we give necessary and sufficient conditions for two *-bisimple type $A \omega^{2}$ semigroups with $\mathcal{D}^{*}=\widetilde{D}$ to be isomorphic. Let $S$, and $S^{\prime}$ be $*$-bisimple type $A \omega^{2}$-semigroups satisfying $\mathcal{D}^{*}=\widetilde{D}$. Suppose that $\sigma: S \rightarrow S^{\prime}$ is a mapping between them. We prove the following theorem.

Theorem 2.1 Let $S=G B R^{*}(M ; \beta, \gamma ; u)$ and $S^{\prime}=G B R^{*}\left(M^{\prime} ; \beta^{\prime}, \gamma^{\prime} ; u^{\prime}\right)$ be *-bisimple type $A \omega^{2}$-semigroups such that $\mathcal{D}^{*}=\widetilde{D}$. Then $S \cong S^{\prime}$ if and only if there exist isomorphism $\alpha$ of $M$ onto $M^{\prime}$ and two inner automorphisms $\tau_{v}$ and $\tau_{w}$ of $M^{\prime}$ such that

$$
\begin{equation*}
\beta \alpha=\alpha \beta^{\prime} \tau_{w}, \quad \gamma \alpha=\alpha \gamma^{\prime} \tau_{v}, \quad u \alpha=\left(w \gamma^{\prime} u^{\prime}\right) \tau_{v} \tag{2.1}
\end{equation*}
$$

where $v$ and $w$ are two units of $M^{\prime}$.
Proof Let $\sigma$ be an isomorphism of $S$ onto $S^{\prime}$. Then $\sigma$ must induce a one-to-one order preserving mapping of $E_{S}$ onto $E_{S^{\prime}}$. Thus ( $\left.m, n, e, n, m\right) \sigma=\left(m, n, e^{\prime}, n, m\right.$ ), for all $m$ and $n$ in $N^{0}$, where we have denoted the identities of both $M$ and $M^{\prime}$ by $e$ and $e^{\prime}$, respectively.

Let $s=(m, n, x, q, p) \in S$ and $s \sigma=(m, n, x, q, p) \sigma=(i, j, y, l, k)=r$. Then

$$
s^{*} \sigma=(s \sigma)^{*}=r^{*}, \quad s^{+} \sigma=(s \sigma)^{+}=r^{+}
$$

which implies that $(p, q, e, q, p) \sigma=\left(k, l, e^{\prime}, l, k\right)$, and $(m, n, e, n, m) \sigma=\left(i, j, e^{\prime}, j, i\right)$; consequently $p=k, q=l, m=i$ and $n=j$.

Now $H_{(0,0),(0,0)}^{*}(S) \sigma=H_{(0,0),(0,0)}^{*}\left(S^{\prime}\right)$ so that $M \cong M^{\prime}$ where $M=H_{(0,0),(0,0)}^{*}(S)$ and $M^{\prime}=H_{(0,0),(0,0)}^{*}\left(S^{\prime}\right)$. Denote the isomorphism between $M$ and $M^{\prime}$ by $\alpha$. By definition then

$$
(0,0, x, 0,0) \sigma=(0,0, x \alpha, 0,0)
$$

As $(0,0, e, 1,0)$ is a regular element in $S$, so is its image $(0,0, e, 1,0) \sigma$ in $S^{\prime}$. Suppose that $(0,0, e, 1,0) \sigma=(0,0, w, 1,0)$. Then $w$ is evidently a unit in $M^{\prime}$ and $(0,1, e, 0,0) \sigma=\left(0,1, w^{-1}, 0,0\right)$. Thus for all $x \in M$,

$$
(0,1, x \beta, 1,0) \sigma=(0,1, e, 1,0) \sigma(0,0, x, 0,0) \sigma=\left(0,1, e^{\prime}, 1,0\right)(0,0, x \alpha, 0,0)=\left(0,1, x \alpha \beta^{\prime}, 1,0\right)
$$

Also

$$
\begin{aligned}
(0,1, x \beta, 1,0) \sigma & =(0,1, e, 0,0) \sigma(0,0, x \beta, 0,0) \sigma(0,0, e, 1,0) \sigma \\
& =\left(0,1, w^{-1}, 0,0\right)(0,0, x \beta \alpha, 0,0)(0,0, w, 1,0) \\
& =\left(0,1, w^{-1} x \beta \alpha, 0,0\right)(0,0, w, 1,0) \\
& =\left(0,1, w^{-1} x \beta \alpha w, 1,0\right)
\end{aligned}
$$

Therefore, for all $x \in M, x \alpha \beta^{\prime}=w^{-1} x \beta \alpha w$ and hence

$$
x \beta \alpha=w x \alpha \beta^{\prime} w^{-1}=x \alpha \beta^{\prime} \tau_{w}
$$

where $\tau_{w}: M^{\prime} \rightarrow M^{\prime}$ is the automorphism defined by $y \tau_{w}=w y w^{-1}$. Thus we obtain

$$
\beta \alpha=\alpha \beta^{\prime} \tau_{w}
$$

Similarly, suppose that $(0,0, e, 0,1) \sigma=(0,0, v, 0,1)$ for some $v \in M^{\prime}$. Then $v$ is evidently a unit in $M^{\prime}$ and $(1,0, e, 0,0) \sigma=\left(1,0, v^{-1}, 0,0\right)$. Thus, for all $x$ in $M$, we have

$$
\begin{aligned}
\left(1,0, x \alpha \gamma^{\prime}, 0,1\right) & =\left(1,0, e^{\prime}, 0,1\right)(0,0, x \alpha, 0,0) \\
& =(1,0, e, 0,1) \sigma(0,0, x, 0,0) \sigma=(1,0, x \gamma, 0,1) \sigma \\
& =(1,0, e, 0,0) \sigma(0,0, x \gamma, 0,0) \sigma(0,0, e, 0,1) \sigma \\
& =\left(1,0, v^{-1}, 0,0\right)(0,0, x \gamma \alpha, 0,0)(0,0, v, 0,1) \\
& =\left(1,0, v^{-1} x \gamma \alpha, 0,0\right)(0,0, v, 0,1) \\
& =\left(1,0, v^{-1} x \gamma \alpha v, 0,1\right)
\end{aligned}
$$

Hence, for all elements $x$ of $M$, we have $x \alpha \gamma^{\prime}=v^{-1} x \gamma \alpha v$; that is $v x \alpha \gamma^{\prime} v^{-1}=x \gamma \alpha$. Thus we obtain

$$
\gamma \alpha=\alpha \gamma^{\prime} \tau_{v}
$$

Now,

$$
\begin{aligned}
(0,0, u \alpha, 0,0) & =(0,0, u, 0,0) \sigma=(0,0, e, 0,1) \sigma(0,0, e, 1,0) \sigma(1,0, e, 0,0) \sigma \\
& =(0,0, v, 0,1)(0,0, w, 1,0)\left(1,0, v^{-1}, 0,0\right) \\
& =\left(0,0, v w \gamma^{\prime} u^{\prime}, 0,1\right)\left(1,0, v^{-1}, 0,0\right) \\
& =\left(0,0, v w \gamma^{\prime} u^{\prime} v^{-1}, 0,0\right)
\end{aligned}
$$

and so $u \alpha=v w \gamma^{\prime} u^{\prime} v^{-1}$. Thus $u \alpha=\left(w \gamma^{\prime} u^{\prime}\right) \tau_{v}$.
Conversely, suppose that there exists an isomorphism $\alpha$ of $M$ onto $M^{\prime}$ such that $\beta \alpha=$ $\alpha \beta^{\prime} \tau_{w}, \gamma \alpha=\alpha \gamma^{\prime} \tau_{v}$ and $u \alpha=\left(w \gamma^{\prime} u^{\prime}\right) \tau_{v}$ for some unit $w$ of $M^{\prime}$ and some unit $v$ of $M^{\prime}$.

For each positive integer $m$, let $w_{m}=w\left(w \beta^{\prime}\right) \cdots\left(w \beta^{\prime m-1}\right)$ and $v_{m}=v\left(v \gamma^{\prime}\right) \cdots\left(v \gamma^{\prime m-1}\right)$. Then $w_{m}^{-1}=\left(w^{-1} \beta^{\prime m-1}\right) \cdots\left(w^{-1} \beta^{\prime}\right) w^{-1}$ and $v_{m}^{-1}=\left(v^{-1} \gamma^{\prime m-1}\right) \cdots\left(v^{-1} \gamma^{\prime}\right) v^{-1}$. Let $w_{0}=v_{0}=$ $e^{\prime}$. Note that $w_{1}=w$ and $v_{1}=v$. We claim that

$$
\begin{equation*}
\beta^{i} \alpha=\alpha \beta^{\prime i} \tau_{w_{i}} \tag{2.2}
\end{equation*}
$$

where $i \in N^{0}$. Clearly this is true for $i=0$. Suppose that it is true for $i=m$, and let $x \in M^{\prime}$. Then

$$
x \tau_{w} \beta^{\prime m} \tau_{w_{m}}=\left(w x w^{-1}\right) \beta^{\prime m} \tau_{w_{m}}=\left(w \beta^{\prime m} x \beta^{\prime m} w^{-1} \beta^{\prime m}\right) \tau_{w_{m}}=x \beta^{\prime m} \tau_{w_{m+1}}
$$

and so $\tau_{w} \beta^{\prime m} \tau_{w_{m}}=\beta^{\prime m} \tau_{w_{m+1}}$. Thus, by virtue of (2.1), we have

$$
\beta^{m+1} \alpha=\beta \alpha \beta^{\prime m} \tau_{w_{m}}=\alpha \beta^{\prime} \tau_{w} \beta^{\prime m} \tau_{w_{m}}=\alpha \beta^{\prime m+1} \tau_{w_{m+1}}
$$

and so (2.2) holds by induction. Similarly, we have that

$$
\begin{equation*}
\gamma^{i} \alpha=\alpha \gamma^{\prime i} \tau_{v_{i}} \tag{2.3}
\end{equation*}
$$

where $i \in N^{0}$.

We note that

$$
\begin{equation*}
u^{r} \alpha=\left(w_{r} \gamma^{\prime} u^{\prime r}\right) \tau_{v} \tag{2.4}
\end{equation*}
$$

where $r \in N^{0}$. Clearly this is true for $r=0$. Assume that it holds for $r=n$. Then, by (1.1), we have $\gamma^{\prime} \tau_{u^{\prime}}=\beta^{\prime} \gamma^{\prime}$ and so

$$
u^{\prime n} w \gamma^{\prime}=u^{\prime n-1} w \beta^{\prime} \gamma^{\prime} u^{\prime}=u^{\prime n-2} w \beta^{2} \gamma^{\prime} u^{\prime 2}=\cdots=w \beta^{\prime n} \gamma^{\prime} u^{\prime n}
$$

and

$$
\begin{aligned}
u^{n+1} \alpha & =u^{n} \alpha u \alpha=\left(w_{n} \gamma^{\prime} u^{\prime n}\right) \tau_{v}\left(w \gamma^{\prime} u^{\prime}\right) \tau_{v}=\left(w_{n} \gamma^{\prime} u^{\prime n} w \gamma^{\prime} u^{\prime}\right) \tau_{v} \\
& =\left(w_{n} \gamma^{\prime} w \beta^{\prime n} \gamma^{\prime} u^{\prime n} u^{\prime}\right) \tau_{v}=\left(w_{n+1} \gamma^{\prime} u^{\prime n+1}\right) \tau_{v}
\end{aligned}
$$

Hence the result holds for $r=n+1$ and so, by induction, it holds for all positive non-negative $r$.
Write $h=(0,0, w, 1,0)$. As $w$ is a unit in $M^{\prime}$, then $(0,0, w, 1,0),\left(0,1, w^{-1}, 0,0\right)$ must be mutually inverse regular elements of $S^{\prime}$ and so $h^{-1}=\left(0,1, w^{-1}, 0,0\right)$. Let $k=(0,0, v, 0,1)$. Similarly, $(0,0, v, 0,1),\left(1,0, v^{-1}, 0,0\right)$ must be mutually inverse regular elements of $S^{\prime}$ and so $k^{-1}=\left(1,0, v^{-1}, 0,0\right)$. Write $h^{0}=\left(0,0, e^{\prime}, 0,0\right)$ and $k^{0}=\left(0,0, e^{\prime}, 0,0\right)$. A straightforward calculation shows that

$$
\begin{align*}
& h^{n}=\left(0,0, w_{n}, n, 0\right), \quad h^{-n}=\left(0, n, w_{n}^{-1}, 0,0\right) \\
& k^{n}=\left(0,0, v_{n}, 0, n\right), \quad k^{-n}=\left(n, 0, v_{n}^{-1}, 0,0\right) \tag{2.5}
\end{align*}
$$

for all non-negative integers $n$.
Let $\sigma$ be a mapping from $S$ into $S^{\prime}$, defined by

$$
(m, n, x, q, p) \sigma=k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{p}
$$

Thus, applying (2.5), we see that

$$
(m, n, x, q, p) \sigma=\left(m, n,\left(v_{m}^{-1} \beta^{\prime n} w_{n}^{-1}\right) x \alpha\left(w_{q} v_{p} \beta^{\prime q}\right), q, p\right)
$$

and so $\sigma$ is a bijection.
Let $(m, n, x, q, p),\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \in S$. We shall show that

$$
\begin{equation*}
(m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma=\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma \tag{2.6}
\end{equation*}
$$

It is convenient to consider separately the following five cases.
Case I $p=m^{\prime}$ and $q=n^{\prime}$. In this case, we have

$$
\begin{aligned}
& (m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& \quad=k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{p} k^{-m^{\prime}} h^{-n^{\prime}}\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0,\left(x x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}}=\left(m, n, x x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& \quad=\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma .
\end{aligned}
$$

Case II $p=m^{\prime}$ and $q>n^{\prime}$. In this case, by (2.2), we have

$$
w_{q-n^{\prime}} x^{\prime} \alpha \beta^{\prime q-n^{\prime}}=x^{\prime} \beta^{q-n^{\prime}} \alpha w_{q-n^{\prime}} .
$$

Thus, using (2.5), we obtain

$$
\begin{aligned}
&(m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& \quad=k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{p} k^{-m^{\prime}} h^{-n^{\prime}}\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}(0,0, x \alpha, 0,0)\left(0,0, w_{q-n^{\prime}}, q-n^{\prime}, 0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0, x \alpha w_{q-n^{\prime}}, q-n^{\prime}, 0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0, x \alpha w_{q-n^{\prime}} x^{\prime} \alpha \beta^{\prime q-n^{\prime}}, q-n^{\prime}, 0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0, x \alpha x^{\prime} \beta^{q-n^{\prime}} \alpha w_{q-n^{\prime}}, q-n^{\prime}, 0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0,\left(x x^{\prime} \beta^{q-n^{\prime}}\right) \alpha, 0,0\right)\left(0,0, w_{q-n^{\prime}}, q-n^{\prime}, 0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0,0,\left(x x^{\prime} \beta^{q-n^{\prime}}\right) \alpha, 0,0\right) h^{q^{\prime}-n^{\prime}+q} k^{p^{\prime}} \\
& \quad=\left(m, n, x x^{\prime} \beta^{q-n^{\prime}}, q^{\prime}-n^{\prime}+q, p^{\prime}\right) \sigma \\
& \quad=\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma .
\end{aligned}
$$

Case III $p=m^{\prime}$ and $q<n^{\prime}$. In this case, by (2.2), we have

$$
w_{n^{\prime}-q}^{-1} x \beta^{n^{\prime}-q} \alpha=x \alpha \beta^{\prime n^{\prime}-q} w_{n^{\prime}-q}^{-1}
$$

Thus, using (2.5), we obtain

$$
\begin{aligned}
&( m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& \quad=k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{p} k^{-m^{\prime}} h^{-n^{\prime}}\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}(0,0, x \alpha, 0,0)\left(0, n^{\prime}-q, w_{n^{\prime}-q}^{-1}, 0,0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0, n^{\prime}-q, x \alpha \beta^{\prime n^{\prime}-q} w_{n^{\prime}-q}^{-1}, 0,0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0, n^{\prime}-q, x \alpha \beta^{\prime n^{\prime}-q} w_{n^{\prime}-q}^{-1} x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0, n^{\prime}-q, w_{n^{\prime}-q}^{-1} x \beta^{n^{\prime}-q} \alpha x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-n}\left(0, n^{\prime}-q, w_{n^{\prime}-q}^{-1}, 0,0\right)\left(0,0,\left(x \beta^{n^{\prime}-q} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=k^{-m} h^{-\left(n+n^{\prime}-q\right)}\left(0,0,\left(x \beta^{n^{\prime}-q} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& \quad=\left(m, n+n^{\prime}-q, x \beta^{n^{\prime}-q} x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& \quad=\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma .
\end{aligned}
$$

Case IV $p>m^{\prime}$. Utilizing (2.2), (2.3) and (2.4), it is easy to see that $\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \alpha=$ $\left(u^{n^{\prime}} \alpha\right)^{-1} x^{\prime} \gamma \alpha u^{q^{\prime}} \alpha=v u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q^{\prime}} v^{-1}$ and so

$$
\begin{aligned}
& \left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \alpha \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{w_{q}\left(v_{p-m^{\prime}-1} \beta^{\prime q}\right)} \\
& \quad=\left[v u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q^{\prime}} v^{-1}\right] \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{w_{q}\left(v_{p-m^{\prime}-1} \beta^{\prime q}\right)} \\
& \quad=\left\{v \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}\left[u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q^{\prime}}\right] \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} v^{-1} \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}\right\} \tau_{w_{q}\left(v_{p-m^{\prime}-1} \beta^{\prime q}\right)} \\
& \quad=\left[u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q^{\prime}}\right] \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{v \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}} \tau_{w_{q}\left(v_{p-m^{\prime}-1} \beta^{\prime q}\right)} \\
& \quad=\left[u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q^{\prime}}\right] \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right)} .
\end{aligned}
$$

By virtue of (2.2), (2.3) and (2.4) we have

$$
\begin{aligned}
& \left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q} \alpha w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) \\
& =\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \alpha \beta^{\prime q} \tau_{w_{q}} w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) \\
& =\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \alpha \gamma^{\prime p-m^{\prime}-1} \tau_{v_{p-m^{\prime}-1}} \beta^{\prime q} \tau_{w_{q}} w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) \\
& =\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \alpha \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{w_{q}\left(v_{p-m^{\prime}}-\beta^{\prime q}\right)} w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) \\
& =\left[u^{\prime-n^{\prime}}\left(w_{n^{\prime}}^{-1} x^{\prime} \alpha w_{q^{\prime}}\right) \gamma^{\prime} u^{\prime q} q^{\prime}\right] \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \tau_{w_{q}\left(v_{p-m^{\prime}, \beta^{\prime q} q}\right)} w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) \\
& =w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right)\left(u^{\prime-n^{\prime}} w_{n^{\prime}}^{-1} \gamma^{\prime} u^{\prime 0}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \\
& \quad x^{\prime} \alpha \gamma^{\prime} \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}\left(u^{\prime 0} w_{q^{\prime}} \gamma^{\prime} u^{\prime q^{\prime}}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}
\end{aligned}
$$

and so

$$
\begin{aligned}
& x \alpha w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right)\left(u^{\prime-n^{\prime}} w_{n^{\prime}}^{-1} \gamma^{\prime}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} x^{\prime} \alpha \gamma^{\prime p-m^{\prime}} \beta^{\prime q}\left(w_{q^{\prime}} \gamma^{\prime} u^{\prime q^{\prime}}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} \\
& \quad=\left(x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}\right) \alpha w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right) .
\end{aligned}
$$

Thus, by (2.5), we obtain

$$
\begin{aligned}
& (m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& =k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{p-m^{\prime}} h^{-n^{\prime}}\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =k^{-m} h^{-n}(0,0, x \alpha, 0,0)\left(0,0, w_{q}, q, 0\right)\left(0,0, v_{p-m^{\prime}}, 0, p-m^{\prime}\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right) \\
& \left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0, x \alpha w_{q}, q, 0\right)\left(0,0, v_{p-m^{\prime}}, 0, p-m^{\prime}\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0, x \alpha w_{q}\left(v_{p-m^{\prime}}\right) \beta^{\prime q}, q, p-m^{\prime}\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right)\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0, x \alpha w_{q}\left(v_{p-m^{\prime}}\right) \beta^{\prime q}\left(u^{\prime-n^{\prime}} w_{n^{\prime}}^{-1} \gamma^{\prime} u^{\prime 0}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}, q, p-m^{\prime}\right) \\
& \left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0, x \alpha w_{q}\left(v_{p-m^{\prime}}\right) \beta^{\prime q}\left(u^{\prime-n^{\prime}} w_{n^{\prime}}^{-1} \gamma^{\prime} u^{\prime 0}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} x^{\prime} \alpha \gamma^{\prime} \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}, q, p-m^{\prime}\right) \\
& \left(0,0, w_{q^{\prime}}, q^{\prime}, 0\right) k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0, x \alpha w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right)\left(u^{\prime-n^{\prime}} w_{n^{\prime}}^{-1} \gamma^{\prime}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q} x^{\prime} \alpha \gamma^{\prime p-m^{\prime}} \beta^{\prime q}\right. \\
& \left.\left(w_{q^{\prime}} \gamma^{\prime} u^{\prime q^{\prime}}\right) \gamma^{\prime p-m^{\prime}-1} \beta^{\prime q}, q, p-m^{\prime}\right) k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0,\left(x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}\right) \alpha w_{q}\left(v_{p-m^{\prime}} \beta^{\prime q}\right), q, p-m^{\prime}\right) k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0,\left(x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}\right) \alpha w_{q}, q, 0\right)\left(0,0, v_{p-m^{\prime}}, 0, p-m^{\prime}\right) k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0,\left(x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}\right) \alpha, 0,0\right)\left(0,0, w_{q}, q, 0\right)\left(0,0, v_{p-m^{\prime}}, 0, p-m^{\prime}\right) k^{p^{\prime}} \\
& =k^{-m} h^{-n}\left(0,0,\left(x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}\right) \alpha, 0,0\right) h^{q} k^{p-m^{\prime}} k^{p^{\prime}} \\
& =\left(m, n, x\left(u^{-n^{\prime}} x^{\prime} \gamma u^{q^{\prime}}\right) \gamma^{p-m^{\prime}-1} \beta^{q}, q, p+p^{\prime}-m^{\prime}\right) \sigma \\
& =\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma \text {. }
\end{aligned}
$$

Case V $p<m^{\prime}$. Utilizing (2.2), (2.3) and (2.4), it is easy to see that

$$
\left(u^{-n} x \gamma u^{q}\right) \alpha=\left(u^{n} \alpha\right)^{-1} x \gamma \alpha u^{q} \alpha=v u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q} v^{-1}
$$

and so

$$
\begin{aligned}
& \left(u^{-n} x \gamma u^{q}\right) \alpha \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right)} \\
& =\left[v u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q} v^{-1}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right)} \\
& =\left\{v \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}}\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} v^{-1} \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right\} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right)} \\
& =\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} \tau_{v \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}}} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right)} \\
& =\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p} \beta^{\prime n^{\prime}}\right)} .
\end{aligned}
$$

By virtue of (2.2), (2.3) and (2.4) we have

$$
\begin{aligned}
& v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} \alpha \\
& \quad=v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \alpha \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}} \\
& \quad=v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(u^{-n} x \gamma u^{q}\right) \alpha \gamma^{\prime m^{\prime}-p-1} \tau_{v_{m^{\prime}-p-1}} \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}} \\
& \quad=v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(u^{-n} x \gamma u^{q}\right) \alpha \gamma^{\prime m^{\prime}-p-1}{\beta^{\prime n^{\prime}}}^{\tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p-1} \beta^{\prime n^{\prime}}\right)}} \\
& \left.\quad=v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} \tau_{w_{n^{\prime}}\left(v_{m^{\prime}-p} \beta^{\prime n^{\prime}}\right)}\right) \\
& \quad=\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime n^{\prime}} v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}
\end{aligned}
$$

and so

$$
\left\{\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} v_{m^{\prime}-p}^{-1}\right\} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1} x^{\prime} \alpha=v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}\right) \alpha
$$

Thus, by (2.5), we obtain

$$
\begin{aligned}
&(m, n, x, q, p) \sigma\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
&= k^{-m} h^{-n}(0,0, x \alpha, 0,0) h^{q} k^{-\left(m^{\prime}-p\right)} h^{-n^{\prime}}\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(0, n, w_{n}^{-1}, 0,0\right)(0,0, x \alpha, 0,0)\left(0,0, w_{q}, q, 0\right)\left(m^{\prime}-p, 0, v_{m^{\prime}-p}^{-1}, 0,0\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right) \\
&\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(0, n, w_{n}^{-1} x \alpha, 0,0\right)\left(0,0, w_{q}, q, 0\right)\left(m^{\prime}-p, 0, v_{m^{\prime}-p}^{-1}, 0,0\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right) \\
&\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(0, n, w_{n}^{-1} x \alpha w_{q}, q, 0\right)\left(m^{\prime}-p, 0, v_{m^{\prime}-p}^{-1}, 0,0\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right) \\
&\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, 0,\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} \beta^{\prime 0} v_{m^{\prime}-p}^{-1}, 0,0\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right) \\
&\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, n^{\prime},\left\{\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} v_{m^{\prime}-p}^{-1}\right\} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}, 0,0\right) \\
&\left(0,0, x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, n^{\prime},\left\{\left[u^{\prime-n}\left(w_{n}^{-1} x \alpha w_{q}\right) \gamma^{\prime} u^{\prime q}\right] \gamma^{\prime m^{\prime}-p-1} v_{m^{\prime}-p}^{-1}\right\} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1} x^{\prime} \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, n^{\prime}, v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}\left(\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, n^{\prime}, v_{m^{\prime}-p}^{-1} \beta^{\prime n^{\prime}} w_{n^{\prime}}^{-1}, 0,0\right)\left(0,0,\left(\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
&= k^{-m}\left(m^{\prime}-p, 0, v_{m^{\prime}-p}^{-1}, 0,0\right)\left(0, n^{\prime}, w_{n^{\prime}}^{-1}, 0,0\right)\left(0,0,\left(\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}}
\end{aligned}
$$

$$
\begin{aligned}
& =k^{-\left(m+m^{\prime}-p\right)} h^{-n^{\prime}}\left(0,0,\left(\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}\right) \alpha, 0,0\right) h^{q^{\prime}} k^{p^{\prime}} \\
& =\left(m+m^{\prime}-p, n^{\prime},\left(u^{-n} x \gamma u^{q}\right) \gamma^{m^{\prime}-p-1} \beta^{n^{\prime}} x^{\prime}, q^{\prime}, p^{\prime}\right) \sigma \\
& =\left[(m, n, x, q, p)\left(m^{\prime}, n^{\prime}, x^{\prime}, q^{\prime}, p^{\prime}\right)\right] \sigma
\end{aligned}
$$

This completes the proof.
